Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

	·
3	sending a forward message to a destination when that forward message has a
4	higher priority than other forward messages addressed to that destination.
1	4. (Original) The method of claim 3, wherein the priority of each forward
2	message represents an age of that forward message.
2	message represents an age of that forward message.
1	5. (Previously presented) The method of claim 1, further comprising:
2	associated a priority with each reverse message; and
3	sending a reverse message to the source when that reverse message has a higher
4	priority than other reverse messages.
	(Ovining) The mosth of a falcing for whomein the amiculture for all mayones
1	6. (Original) The method of claim 5, wherein the priority of each reverse
2	message represents an age of that reverse message.
1	7. (Original) The method of claim 1, wherein each destination is a memory
2	bank, each forward message is a memory transaction, and each reverse message is the result of
3	one of the memory transaction.
1	8. (Currently amended) An apparatus comprising:
2	means for serially receiving, from a source, a plurality of forward messages each
3	addressed to one of a plurality of destinations, wherein each forward message is received at a
4	destination directly from the source;
5	means for receiving a plurality of availability signals, each availability signal
6	indicating that one of the destinations is available to accept a forward message;
7	means for simultaneously sending a forward message to each available
8	destination;
9	means for simultaneously receiving, after a predetermined period of time, a
10	plurality of reverse messages from the destinations, each reverse message corresponding to one
11	of the forward messages simultaneously sent to an available destination; and
12	means for serially sending the reverse messages to the source.

l	9. (Original) The apparatus of claim 8, wherein the source identifies each	11 01
2	the forward messages by a different tag, further comprising:	
3	means for placing a tag in a delay buffer when sending to a destination the	
4	forward message identified by that tag, where the delay buffer implements a delay equal to the	ne
5	predetermined period of time such that the tag is available when receiving from memory the	
5	reverse message corresponding to the forward message; and	
7	means for sending the tag to the source with the reverse message, whereby the	;
3	source associates the reverse message with the forward message.	
l	10. (Original) The apparatus of claim 8, further comprising:	
2	means for associating a priority with each forward message; and	
3	means for sending a forward message to a destination when that forward mess	sage
4	has a higher priority than other forward messages addressed to that destination.	
l	11. (Original) The apparatus of claim 10, wherein the priority of each for	ward
2	message represents an age of that forward message.	
1	12. (Previously presented) The apparatus of claim 8, further comprising:	
2	means for associated a priority with each reverse message; and	
3	means for sending a reverse message to the source when that reverse message	has
4	a higher priority than other reverse messages.	
	12 (Overing 1). The appropriate of claims 12 problems in the projective of each may	
l	13. (Original) The apparatus of claim 12, wherein the priority of each rev	erse
2	message represents an age of that reverse message.	
1	14. (Original) The apparatus of claim 8, wherein each destination is a	
2	memory bank, each forward message is a memory transaction, and each reverse message is t	he
3	result of one of the memory transactions.	

1	15. (Currently amended) A computer program product, tangibly stored on a
2	computer-readable medium, comprising instructions operable to cause a programmable processor
3	to:
4	serially receive, from a source, a plurality of forward messages each addressed to
5	one of a plurality of destinations, wherein each forward message is received at a destination
6	directly from the source;
7	receive a plurality of availability signals, each availability signal indicating that
8	one of the destinations is available to accept a forward message;
9	simultaneously send a forward message to each available destination;
10	simultaneously receive, after a predetermined period of time, a plurality of reverse
11	messages from the destinations, each reverse message corresponding to one of the forward
12	messages simultaneously sent to an available destination; and
13	serially send the reverse messages to the source.
1	16. (Original) The computer program product of claim 15, wherein the source
2	identifies each of the forward messages by a different tag, further comprising instructions
3	operable to cause a programmable processor to:
4	place a tag in a delay buffer when sending to a destination the forward message
5	identified by that tag, wherein the delay buffer implements a delay equal to the predetermined
6	period of time such that the tag is available when receiving from memory the reverse message
7	corresponding to the forward message; and
8	send the tag to the source with the reverse message, whereby the source associates
9	the reverse message with the forward message.
1	17. (Original) The computer program product of claim 15, further comprising
2	instructions operable to cause a programmable processor to:
3	associate a priority with each forward message; and

message is the result of one of the memory transactions.

3

send a forward message to a destination when that forward message has a higher 4 5 priority than other forward messages addressed to that destination. (Original) The computer program product of claim 17, wherein the 1 18. priority of each forward message represents an age of that forward message. 2 (Previously presented) The computer program product of claim 15, 19. 1 further comprising instructions operable to cause a programmable processor to: 2 3 associate a priority with each reverse message; and 4 send a reverse message to the source when that reverse message has a higher 5 priority than other reverse messages. 1 20. (Original) The computer program product of claim 19, wherein the 2 priority of each reverse message represents an age of that reverse message. 21. (Original) The computer program product of claim 15, wherein each 1 destination is a memory bank, each forward message is a memory transaction, and each reverse 2
